## Lab Requirements

# Assignment Project Exam Help

- Assembly control flow
- Loading and storing from memory
- Using syscalls

<https://tutorcs.com>  
WeChat: cstutorcs

# Reverse-Polish-Notation (RPN)

## Assignment Project Exam Help

- Also known as postfix notation
- In this method of writing mathematical expressions, the operator follows the operands
- Differs from the more common infix notation, where the operator is between the operands
- Examples:

<https://tutores.com>

[WeChat: cstutores](https://tutores.com)

postfix	infix	result
1 2 +	1 + 2	3
5 4 - 1 -	5 - 4 - 1	0

# Stacks

## Assignment Project Exam Help

- Stacks are a way of storing data in memory
- Is a First-In-First-Out (FIFO) data structure
- Stack terminology:
  - Elements are "pushed" onto the stack, and "popped" from the stack
  - The last element to be pushed onto the stack (that is still in the stack) is referred to as the "top" element
- The only element that can be popped at any given time is the top element

## RPN Expressions in This Lab

# Assignment Project Exam Help

- Your assignment will require parsing an RPN expression that evaluates to a value
- These RPN expressions will be passed as input to your function in the form of an array of tokens.
- This array is composed of four different types of tokens
  - OPERAND
  - PLUS
  - MINUS
  - TERMINATION
- OPERAND tokens represent operands, PLUS and MINUS tokens represent operators, and the TERMINATION token signifies the end of the expression

# Assignment

## Assignment Project Exam Help

- Write a function called *calculator* that computes and prints the result of a Reverse-Polish-Notation expression
- Input:
  - *a0*: The address of memory containing an array of tokens making up an RPN expression
  - *a1*: The address of memory at which to begin growing your stack
- Effect:
  - Prints the result of the expression stored in *a0* to standard output

<https://tutorcs.com>

WeChat: cstutorcs

## Recommended Strategy

- Iterate over every token in the array passed to your function
- For each token:
  - If it is an OPERAND:
    - Push the operand to your stack
  - If it is a PLUS:
    - Pop two operands from the stack, add the values together, then push the resulting value to the stack
  - If it is a MINUS:
    - Pop two operands from the stack. If A is the first value you popped and B is the second, compute  $B - A$  and store the resulting value back to the stack
  - If it is a TERMINATION:
    - Pop a value from the stack, print it, then return from your function

# System Calls

## Assignment Project Exam Help

- A list of system calls (syscalls) supported by RARS can be found in the RARS help page
- The syscall you will be using in this lab is `PrintInt`, which prints the integer stored in the `a0` register to standard output
- The `PrintInt` syscall is executed after setting the value of `a7` to 1 and using the `ecall` instruction
- Note: in this lab, do not print any newlines in order to ensure that the grading scripts understand your solution

## Stack Growth Direction

# Assignment Project Exam Help

- The grading scripts for this lab require that your stack grows backwards in memory
  - Therefore, if the base address of your stack was at 0x10010004, you would push the first item at 0x10010004, push the second at 0x10010000, and so on
  - While it may seem more intuitive to grow in the other direction, this design more closely replicates the stacks you will be encountering in this course
  - Marks will be deducted if your stack grows in the wrong direction

# Assignment Tips

## Assignment Project Exam Help

- Read specifications very carefully. Pay special attention to what you have to include - we don't want a `main: label;`.
- Test your assignments on the lab machines before you submit. That's where we'll be marking them.
- Look at the marksheet to get an idea of how the grading will be done.
- Style marks are easy marks. Format your code like the `example.s` file we provided, and write good comments.
- Be sure to submit code that runs and compiles. Otherwise you will lose many marks.
- Every function in RISC-V needs a return statement. At the end of your function's execution, return with the instruction `jr ra`

# Using CheckMyLab

## Assignment Project Exam Help

- CheckMyLab is a great resource for testing your solution before submission

- In order to use it:

- 1 Create a copy of your solution file

- 2 In this new file, delete the `.include "common.s"` line

- 3 Copy the entire code from the `common.s` file, and paste it near the top of your copied file, where the `.include "common.s"` line used to be

- 4 Submit this modified copy of your solution to CheckMyLab

- This will show you which test cases your solution passed or failed, and how they failed

- Note: do not submit this modified copy for marks, as it will not work with the grading scripts
